

MergeRows Documentation

Description: Merge datasets by row.

Author: Joshua Gould, gp-help@broad.mit.edu

Summary: Creates a new merged dataset from a list of datasets. Common columns in the datasets are retained while others are discarded.

Parameters:

Name	Description
input filename1	first file to mergeres, .gct, .snp (non-allele-specific), .cn, .xcn,
	.odf, or .cls file
input filename2	second file to merge
zip filename	zip file containing files to merge. Either a zip file or the input files
	above must be provided.
output	name of the merged file

Output Files:

1. File containing the merged rows. Format of output file is the same as the format of the two input files. If the two input files have different formats, the format of the output file is gct..

Platform Dependencies:

Module type: Preprocess & Utilities

CPU type: any OS: any Language: Java
